

Here is my super-secret and extremely confidential collection of problems that I think would be good for oral exams. It would be so bad if this super-secret and extremely confidential list were to accidentally leak to students, because then students may be well-prepared to answer one or more of these basic yet revealing problems about group theory during their comprehensive conversations! Also, it would be *extra* bad if a github link were to leak, because then students would even be able to see if I added more stuff to the list!!

## Define and prove things

**Problem 1.** Suppose  $G$  is a group, and let  $H$  be a subset of  $G$ .

- (a) Write a careful definition of what it means for  $H$  to be a **subgroup** of  $G$ .
- (b) Prove the “one-step subgroup test:” If  $xy^{-1} \in H$  for all  $x, y \in H$ , then  $H$  is a subgroup of  $G$ .

**Problem 2.** Let  $H$  and  $K$  be subgroups of a group  $G$ , with  $K \leq H \leq G$ .

- (a) Define  $[G : H]$ , the “index of  $H$  in  $G$ .”
- (b) State and prove Lagrange’s theorem.
- (c) Use Lagrange’s theorem to prove the “tower law:”  $[G : K] = [G : H] \cdot [H : K]$ .

**Problem 3.** Let  $G$  be a group,  $N$  a normal subgroup, and  $G/N = \{gN \mid g \in G\}$  be the set of left cosets of  $N$ .

- (a) Write careful definitions for “coset” and “normal subgroup.”
- (b) Explain why  $G/N$  is equivalent to  $N \backslash G = \{Ng \mid g \in G\}$ , the set of right cosets of  $N$ .
- (c) Prove that the binary operation on  $G/N$  defined by

$$aN \cdot bN := (ab)N$$

is “well-defined;” that is, it does not depend on choice of coset representative.

- (d) Prove that  $G/N$  with this binary operation is a group.

**Problem 4.** Suppose that  $\phi : G \rightarrow H$  is a homomorphism.

- (a) Write down a careful definition of a homomorphism.
- (b) Prove that  $\phi(1_G) = 1_H$ .
- (c) Use this result to prove that  $\phi(g^{-1}) = \phi(g)^{-1}$ .
- (d) Now you can show that  $\text{Im}(\phi) := \{\phi(g) \mid g \in G\}$  is a subgroup of \_\_,
- (e) and also that  $\text{Ker}(\phi) := \{g \in G \mid \phi(g) = 1\}$  is a subgroup of \_\_.
- (f) Indeed, you can prove that  $\text{Ker}(\phi)$  is a *normal* subgroup.

## Calculate things

**Problem 5.** A Cayley graph of a mystery group  $G$  of order 12 is shown below; let 1 (not  $e$ ) denote the identity element.

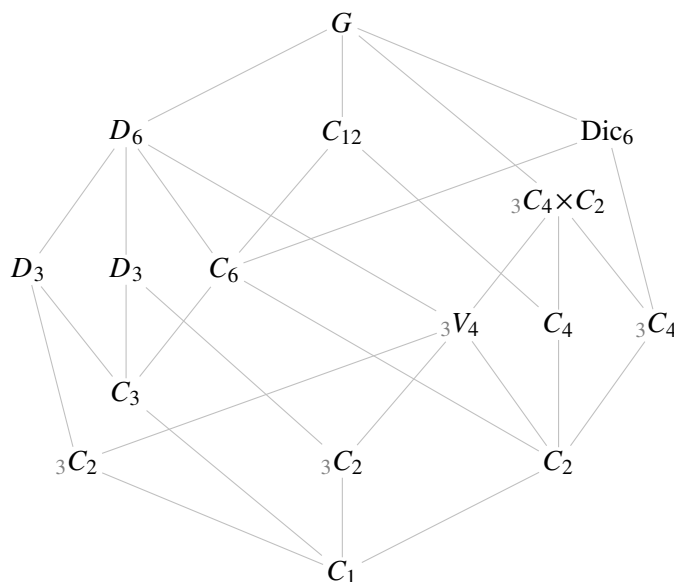

- Write the order of each element in the nodes of the blank Cayley graph on the right.
- The subgroup  $H = \langle a, b \rangle \cong$  \_\_\_\_\_, and  $K = \langle d \rangle \cong$  \_\_\_\_\_.
- The subgroup  $\langle a, d \rangle$  has order \_\_\_\_\_, and is isomorphic to \_\_\_\_\_.
- The subgroup  $\langle b, d \rangle$  has order \_\_\_\_\_, and is isomorphic to \_\_\_\_\_.
- The center of this group is  $Z(G) =$  \_\_\_\_\_. [Write it in terms of generator(s).]
- Find all left cosets of  $H = \langle a, b \rangle$ . Then find all right cosets. Write your answers as subsets of  $G$ , or describe them in words (e.g., “the rows” or “the columns”).
- Find all left cosets of  $K = \langle d \rangle$ . Then find all right cosets. Write your answers as subsets of  $G$ , or describe them in words.
- The normalizers are  $N_G(H) = \langle$  \_\_\_\_\_  $\rangle$  and  $N_G(K) = \langle$  \_\_\_\_\_  $\rangle$ .
- Find all conjugate subgroups to  $H$  and to  $K$ . Write each subgroup only once.
- Is  $H$  normal? Is  $K$  normal?
- Draw the subgroup lattice of  $G$ .

**Problem 6.** Answer questions about the following group, whose subgroup lattice is shown below.

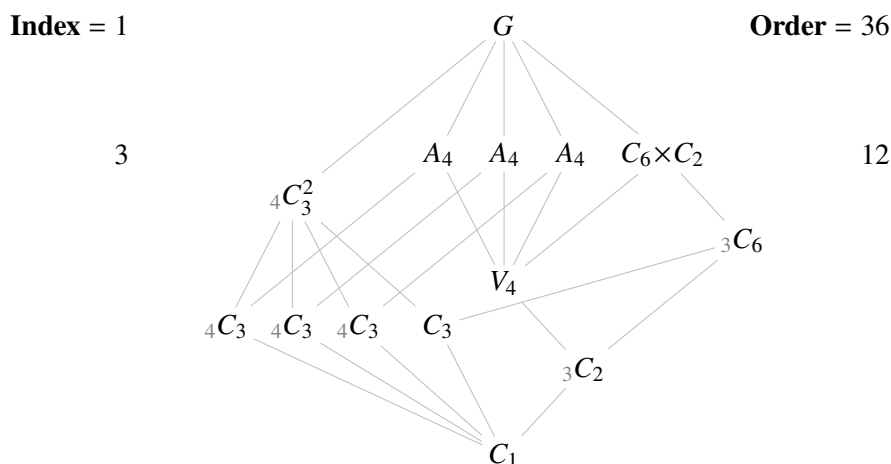

**Order** = 24

**Index**

- Determine the order and the index of each row of subgroups in the lattice.
- $G$  has \_\_\_\_\_ subgroup, which fall into \_\_\_\_\_ conjugacy classes.
- $G$  has exactly \_\_\_\_\_ normal subgroups.
- $G$  has \_\_\_\_\_ subgroup(s) of order 2 and \_\_\_\_\_ element(s) of order 2.
- $G$  has \_\_\_\_\_ subgroup(s) of order 3 and \_\_\_\_\_ element(s) of order 3.
- $G$  has \_\_\_\_\_ subgroup(s) of order 4, of which \_\_\_\_\_ are cyclic.
- Find a normal subgroup  $N \trianglelefteq G$  such that  $G/N \cong V_4$ .
- Each non-normal order-2 subgroup has a normalizer isomorphic to \_\_\_\_\_.
- Each  $D_3$  subgroup has a normalizer isomorphic to \_\_\_\_\_.
- This group has a quotient  $G/C_4$  isomorphic to \_\_\_\_\_. [Hint: Determine the order, then count the index-2 subgroups.]
- This group has a quotient  $G/C_2$  isomorphic to \_\_\_\_\_. [Hint: Same as above.]
- The quotient  $G/C_3$  is isomorphic to \_\_\_\_\_. [Hint: Determine the order. Which lattice do you see?]
- There are  $n_2 = \underline{\hspace{1cm}}$  Sylow 2-subgroups, which are isomorphic to \_\_\_\_\_.
- There are  $n_3 = \underline{\hspace{1cm}}$  Sylow 3-subgroups, which are isomorphic to \_\_\_\_\_.
- The largest order of an element in  $G$  is \_\_\_\_\_, and there are \_\_\_\_\_ element(s) of that order.

**Problem 7.** The subgroup diagram of a group  $G$  is shown below.

- Determine the order and the index of each row of subgroups in the lattice.
- The group  $G$  has \_\_\_\_\_ subgroups, which fall into \_\_\_\_\_ conjugacy classes.
- The quotient of  $G$  by its unique normal subgroup  $N$  of order 3 has order \_\_\_\_\_, and  $G/N$  is isomorphic to the familiar group \_\_\_\_\_.
- There are  $n_2 =$  \_\_\_\_\_ Sylow 2-subgroup(s), isomorphic to \_\_\_\_\_, and  $n_3 =$  \_\_\_\_\_ Sylow 3-subgroup(s), isomorphic to \_\_\_\_\_.
- Find all distinct ways that  $G$  can be written as a direct or semidirect product of two of its proper subgroups.
- Find the center  $Z(G)$ , and justify your answer. Though this cannot always be done by inspection, it can in this case, using a result from the previous part.
- Let  $G$  act on its subgroups by conjugation. This action has \_\_\_\_\_ orbit(s) and \_\_\_\_\_ fixed point(s).
- Let  $G$  act on itself by multiplication. This action has \_\_\_\_\_ orbit(s) and \_\_\_\_\_ fixed point(s).
- Let  $H$  be a subgroup of order 9, and let  $G$  act on the right cosets of  $H$  by right multiplication. This action has \_\_\_\_\_ orbit(s) and \_\_\_\_\_ fixed point(s).
- Still assuming that  $|H| = 9$ , let  $G$  act on the *left* cosets of  $H$  by *left* multiplication. This action has \_\_\_\_\_ orbit(s) and \_\_\_\_\_ fixed point(s).
- Let  $g \in G$  be an element of order 2. Then  $g$  commutes with exactly \_\_\_\_\_ element(s), and the centralizer of  $\langle g \rangle$  is isomorphic to \_\_\_\_\_. The centralizer of  $g$  is (bigger than)(smaller than)(equal to) [ $\leftarrow$  circle one] its normalizer.

**Problem 8.** Consider the following set of “binary rectangles”:

$$S = \left\{ \begin{array}{|c|c|} \hline 0 & 0 \\ \hline 0 & 0 \\ \hline \end{array}, \begin{array}{|c|c|} \hline 0 & 1 \\ \hline 1 & 1 \\ \hline \end{array}, \begin{array}{|c|c|} \hline 1 & 0 \\ \hline 0 & 0 \\ \hline \end{array}, \begin{array}{|c|c|} \hline 1 & 1 \\ \hline 0 & 0 \\ \hline \end{array}, \begin{array}{|c|c|} \hline 1 & 0 \\ \hline 0 & 1 \\ \hline \end{array}, \begin{array}{|c|c|} \hline 0 & 0 \\ \hline 1 & 1 \\ \hline \end{array}, \begin{array}{|c|c|} \hline 0 & 1 \\ \hline 0 & 1 \\ \hline \end{array} \right\}$$

The Klein-4 group  $V = \{1, v, h, vh\}$  acts on  $S$  via  $\phi: V \rightarrow \text{Perm}(S)$ , where

$\phi(v)$  = flips each tile vertically

$\phi(h)$  = flips each tile horizontally

$\phi(vh)$  = rotates each tile by  $180^\circ$

- (a) Pick a minimal generating set and then draw the *action graph*. (Feel free to label the rectangles above A,B,C,D,E,F,G to save time.)

- (b) Find the following:

•  $\text{stab} \left( \begin{array}{|c|c|} \hline 0 & 1 \\ \hline 1 & 1 \\ \hline \end{array} \right) =$

•  $\text{stab} \left( \begin{array}{|c|c|} \hline 1 & 1 \\ \hline 0 & 1 \\ \hline \end{array} \right) =$

•  $\text{stab} \left( \begin{array}{|c|c|} \hline 0 & 0 \\ \hline 0 & 0 \\ \hline \end{array} \right) =$

•  $\text{stab} \left( \begin{array}{|c|c|} \hline 1 & 0 \\ \hline 1 & 0 \\ \hline \end{array} \right) =$

•  $\text{fix}(1) =$

•  $\text{fix}(h) =$

•  $\text{fix}(v) =$

•  $\text{fix}(vh) =$

- This action has \_\_\_\_\_ orbits, which by the orbit-counting theorem, is also equal to the average \_\_\_\_\_.

•  $\text{Fix}(\phi) =$

•  $\text{Ker}(\phi) =$
